Norvig Improvement

The problem is that In Norvig model, only one word can be corrected at a time so what about making a modified model that can detect and correct a complete sentence or more than one word at the same time.

Area of improvement: Automation

Comparison between the output of the old model and the expected Modified Model

Input	Output in old model	Expected Output in the new Model	Explanation
"mdel"	"model"	"model"	One word can be detected and corrected in both models
"welome to the new mdel"	"welome to the new mdel"	"welome to the new model"	The old model can't detect the sentence while the new model detect and correct it
